

# Week 7

28-July

# Goals

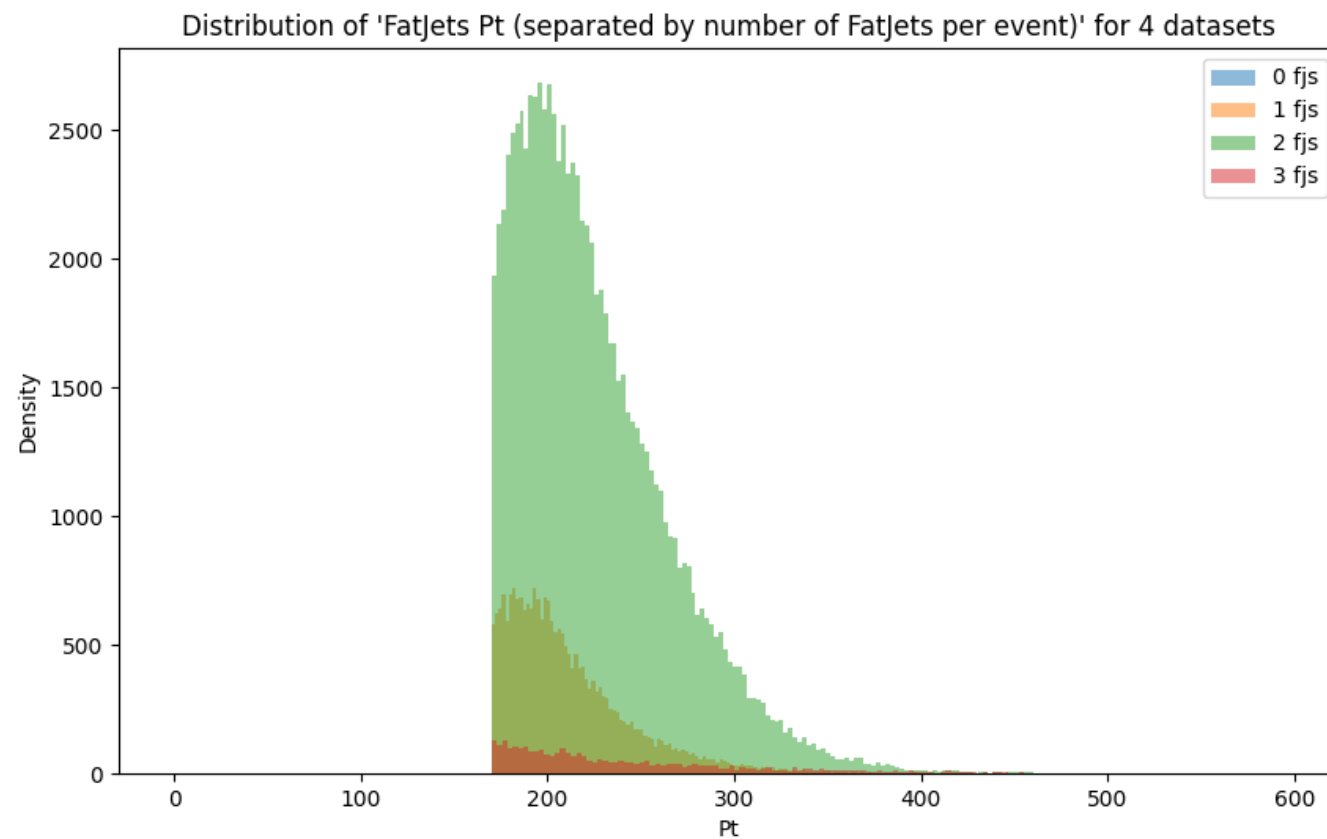

- Familiarize myself with Sas's changes
- Sum all QCD files and then take a  $p_T$  slice

# Sas's Progress

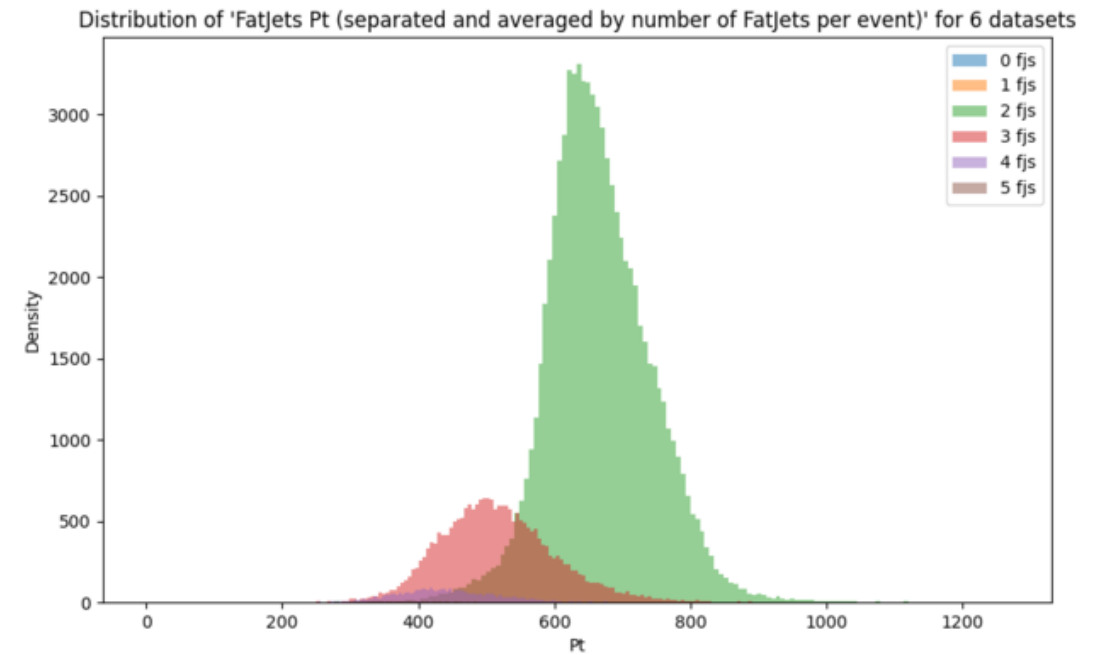

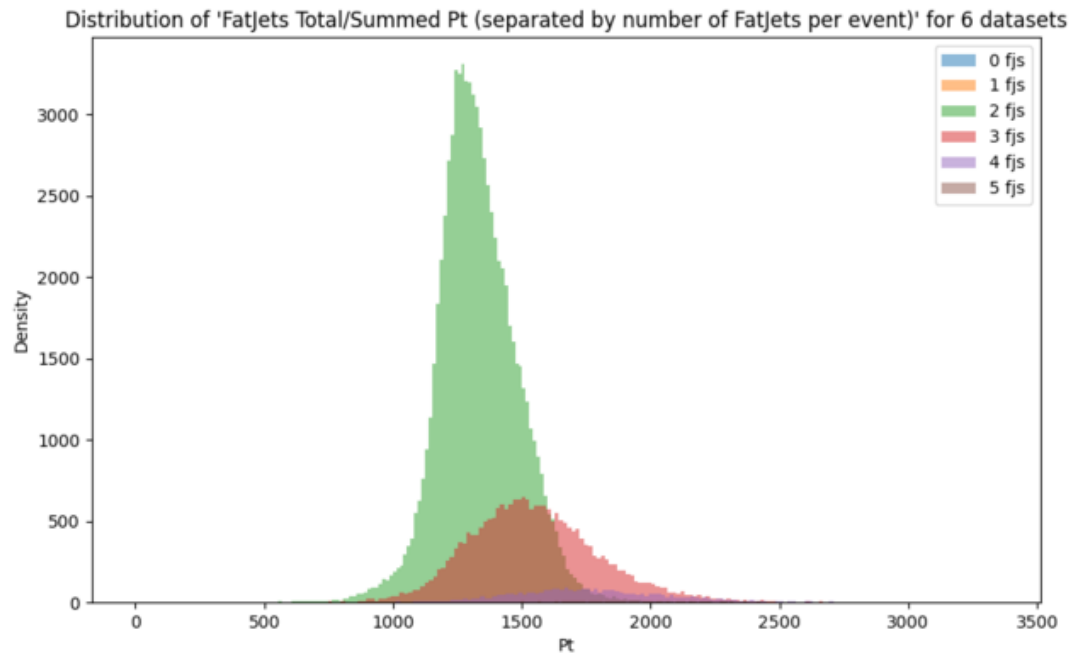

---

- noticed that we were flattening the FatJets, meaning we're treating all FatJets as separate events
  - some events have up to 5 FatJets
- the more FatJets in an event, the lesser the individual Pts (shown in the graph as different Pt distributions for events with different numbers of FatJets)

# Sas's Progress

# Sas's Progress

# Next steps

- Finish processing the pT slices
- Train the model on a particular pT slice
